

Machine Learning Basics

COMP9312_23T2

UNSW
SYDNEY

About this topic

- Introduce basic knowledge about machine learning
- You need them to understand graph neural networks
- All concepts in this topic **would not be** in assignments/exam

Machine Learning \approx Looking for Function

Speech Recognition

$$f\left(\text{[Waveform of 'Hello World']}\right) = \text{"Hello World"}$$

Image Recognition

$$f\left(\text{[Image of a cat]}\right) = \text{"Cat"}$$

ChatGPT

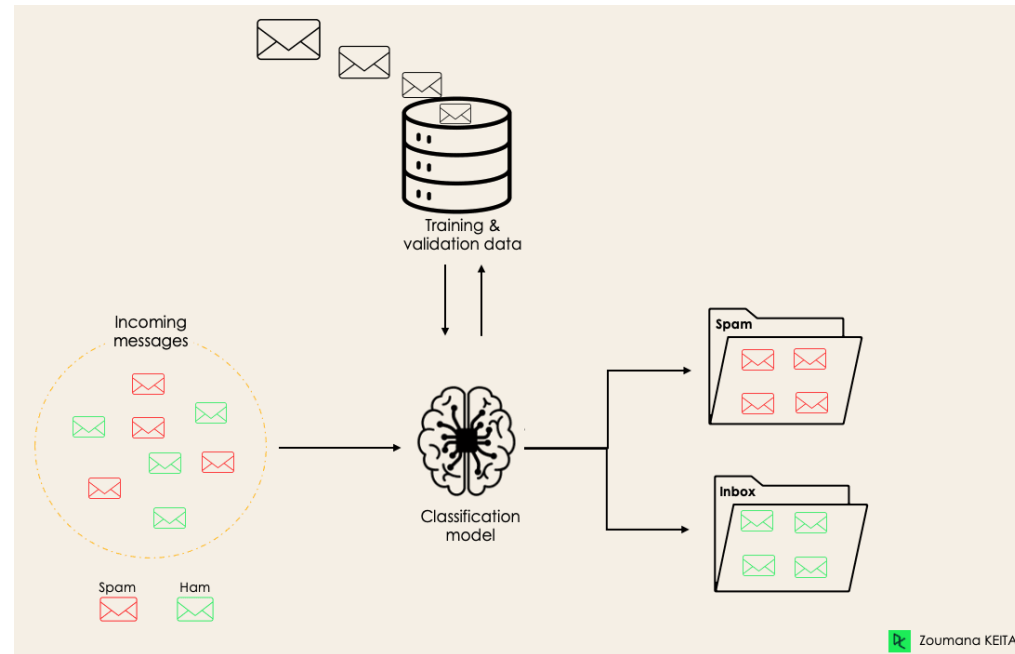

$$f\left(\text{write a solution for my assignment 1}\right) = \text{"..."}$$

Two types of ML function

Regression

Classification

Some Classification Tasks

AlphaGo

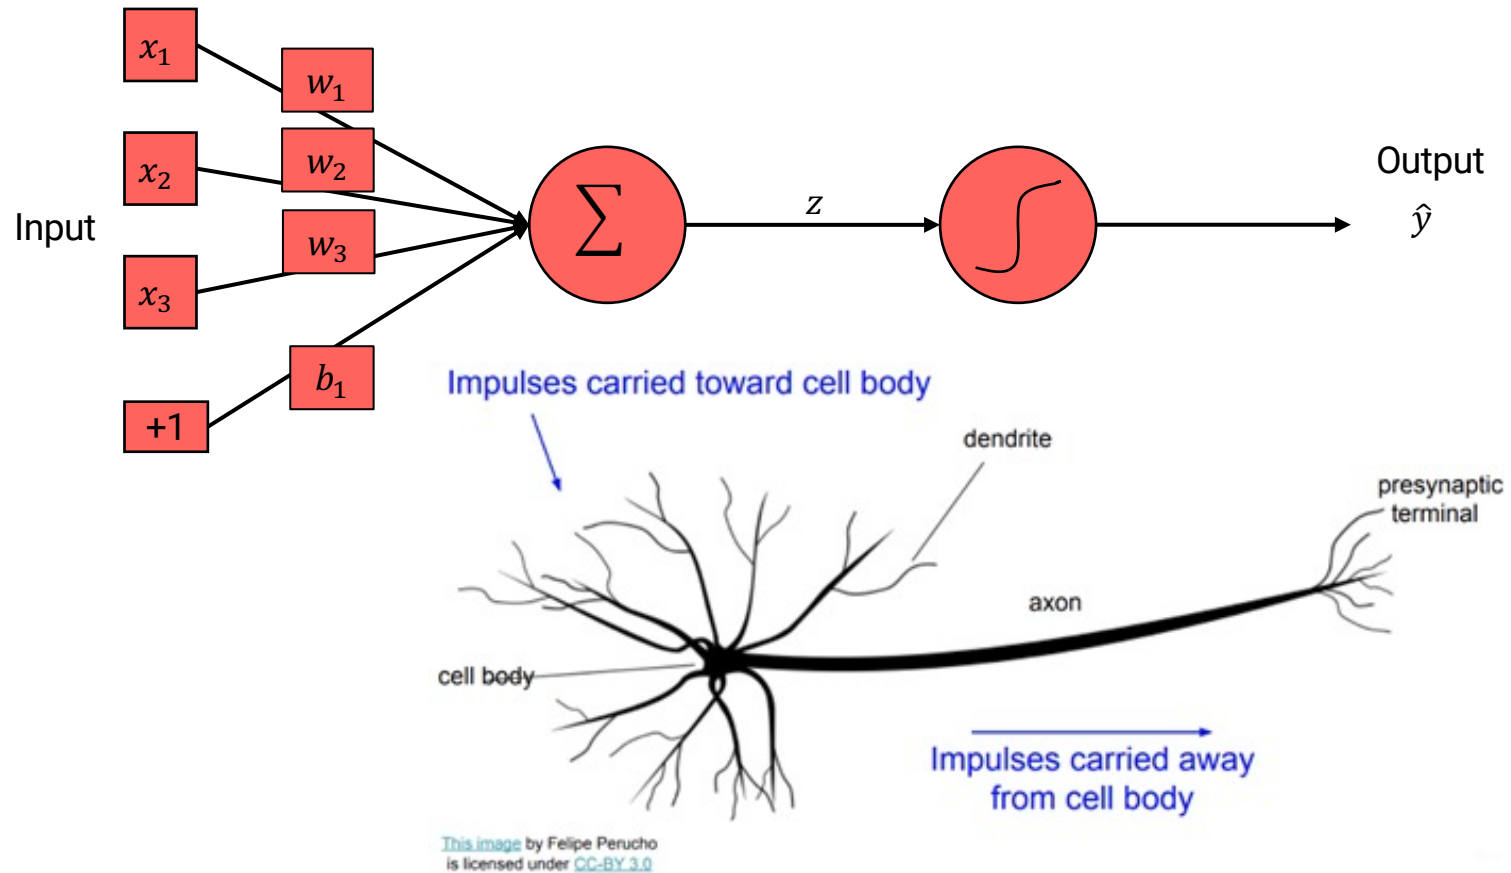

ChatGPT

Machine Learning

- Algorithms that improve automatically through **experience**.
- The algorithm has a (large) number of parameters whose values need to be learned from the data.

Neurons and Perceptron

What does a Perceptron do? (1)

Suppose a NN initialized to weight w be (0.1, 0.2, 0.3) & bias $b = 0.05$

Step0: Take an input x (0.3, 0.6, 0.9)

What does a Perceptron do? (2)

Step1: Calculate a weighted sum

$$z = w^T x + b; z = 0.1 \times 0.3 + 0.2 \times 0.6 + 0.3 \times 0.9 + 0.05 = 0.47$$

What does a Perceptron do? (3)

Step2: Apply an activation function

Neural Networks

X_1	X_2	X_3	Y
1	0	0	0
1	0	1	1
1	1	0	1
1	1	1	1
0	0	1	0
0	1	0	0
0	1	1	1
0	0	0	0

Output Y is 1 if at least two of the three inputs are equal to 1.

Neural Networks (cont)

X_1	X_2	X_3	Y
1	0	0	0
1	0	1	1
1	1	0	1
1	1	1	1
0	0	1	0
0	1	0	0
0	1	1	1
0	0	0	0

$$Y = I(0.3X_1 + 0.3X_2 + 0.3X_3 - 0.4 > 0)$$

$$\text{where } I(z) = \begin{cases} 1 & \text{if } z \text{ is true} \\ 0 & \text{otherwise} \end{cases}$$

Neural Networks (cont)

- Model is an assembly of interconnected nodes and weighted links
- Output node sums up each of its input value according to the weights of its links
- Compare output node against some threshold t
- The sign function (activation function) outputs a value +1 if its argument is positive and -1 otherwise.

Perceptron Model

$$Y = I\left(\sum_i w_i X_i - t\right) \quad \text{or}$$

$$Y = \text{sign}\left(\sum_i w_i X_i - t\right)$$

Increase Expressive Power

From Perceptrons to NN

- Perceptrons are a basic unit of a neural network.
- 1-layered neural network on the right

Structure:

- Input layer, output layer,
- Middle are hidden layers.

A Case Study

What is the final mark of a student in 9312? (a regression problem)

$$f(\text{student's mark for COMP9024}) = ??$$

Where does the machine learn from?

Marks of many previous students for 9024 and 9312 (**Supervised Learning**)

Other types: unsupervised learning (NLP), semi-supervised learning, ...

How to get the function

1. Tell the machine what to learn (Parameters)
2. Tell the machine how to evaluate the function (Loss Function)
3. Wait ... (Training)

Step 1 - Parameters

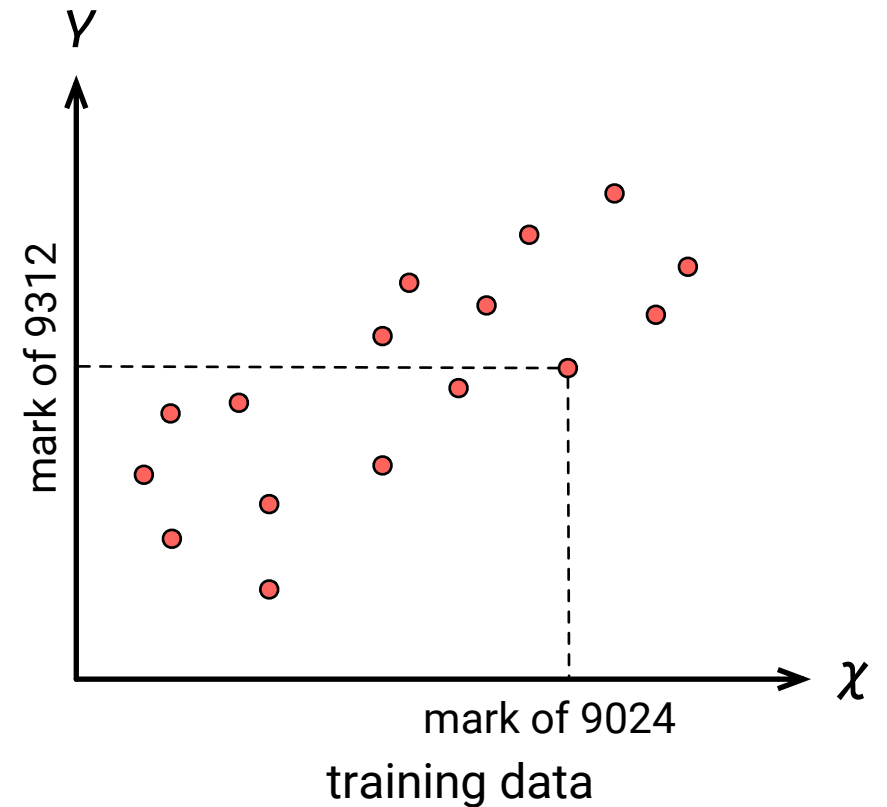

1. Tell the machine what to learn (Parameters)

A linear function based on domain knowledge.

$$y = b + wx_1$$

Diagram illustrating the linear function $y = b + wx_1$. The term b is labeled "bias" (yellow box), w is labeled "weight" (red box), and x_1 is labeled "feature" (black box). Arrows indicate the relationships: w points to wx_1 , b points to b , and x_1 points to wx_1 .

w and b are unknown parameters to learn.

Step 2 – Loss Function

2. Tell the machine how to evaluate the function (Loss Function)

\hat{y} is the label (real value)

y is the estimation

How good is a value / a function?

$$\text{Loss: } L = \frac{1}{N} \sum_n e_n$$

$e = |y - \hat{y}|$ L is mean absolute error (MAE)

$e = (y - \hat{y})^2$ L is mean square error (MSE)

Step 2 – Loss Function

2. Tell the machine how to evaluate the function (Loss Function)

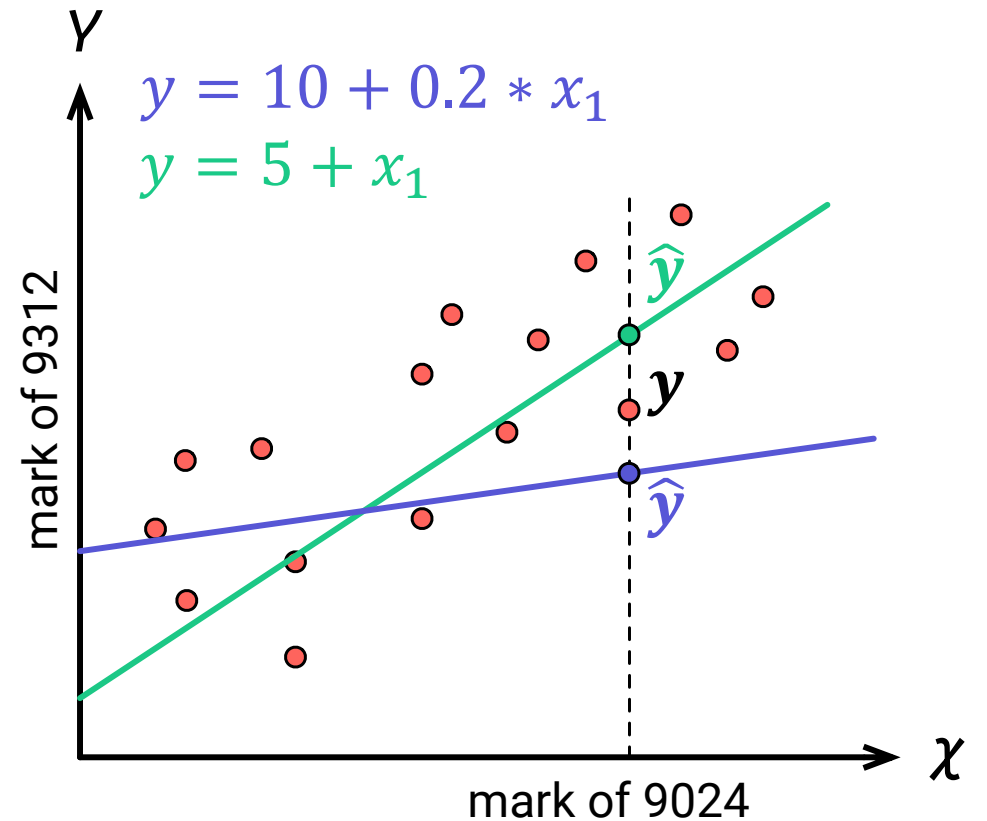

$$y = b + wx_1$$

We aim to find a good w and b to minimize the loss function.

$$\text{Loss: } L = \frac{1}{N} \sum_n e_n$$

$$e = |y - \hat{y}| \quad L \text{ is mean absolute error (MAE)}$$

$$e = (y - \hat{y})^2 \quad L \text{ is mean square error (MSE)}$$

Step 3 - Training

How to get good parameters?

$$y = b + wx_1$$

Gradient Descent.

Done by the toolkit (e.g., pytorch...).

Optional

Gradient Descent

$$y = b + wx_1 \quad w^*, b^* = \arg \min_{w, b} L$$

1. pick a random w^0

2. compute gradient $\frac{\partial L}{\partial w} \Big|_{w=w^0}$

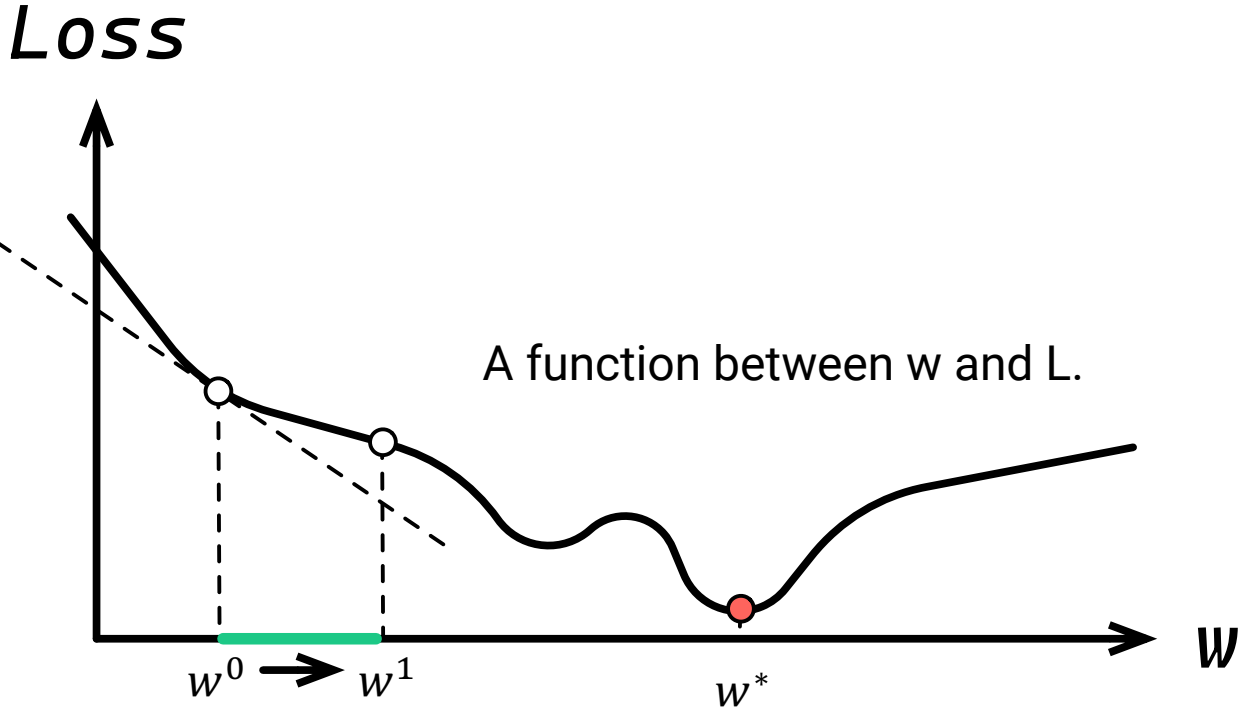

Negative -> increase w^0

Positive -> decrease w^0

3. Update w based on a hyperparameter η

$$w^1 \leftarrow w^0 - \eta \frac{\partial L}{\partial w} \Big|_{w=w^0}$$

4. Update w iteratively.

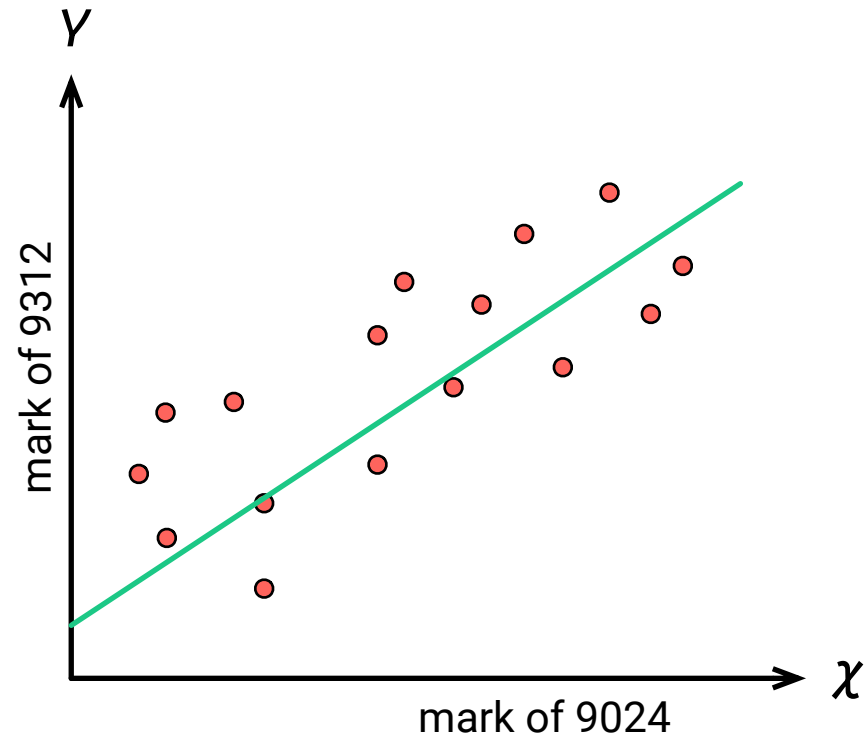

η is also called learning rate.

Evaluate the function

Now we have a good linear function to predict the mark.

$$f(\text{student's mark for COMP9024}) = ??$$

Are linear models good enough?

Beyond Linear Models

Real problems are much more sophisticated.

This is what you expect.

Real scenarios may be terrible ...

How to get sophisticated functions

Combine simple functions in two ways:

$$f_1(x) + f_2(x) \qquad f_1(f_2(x))$$

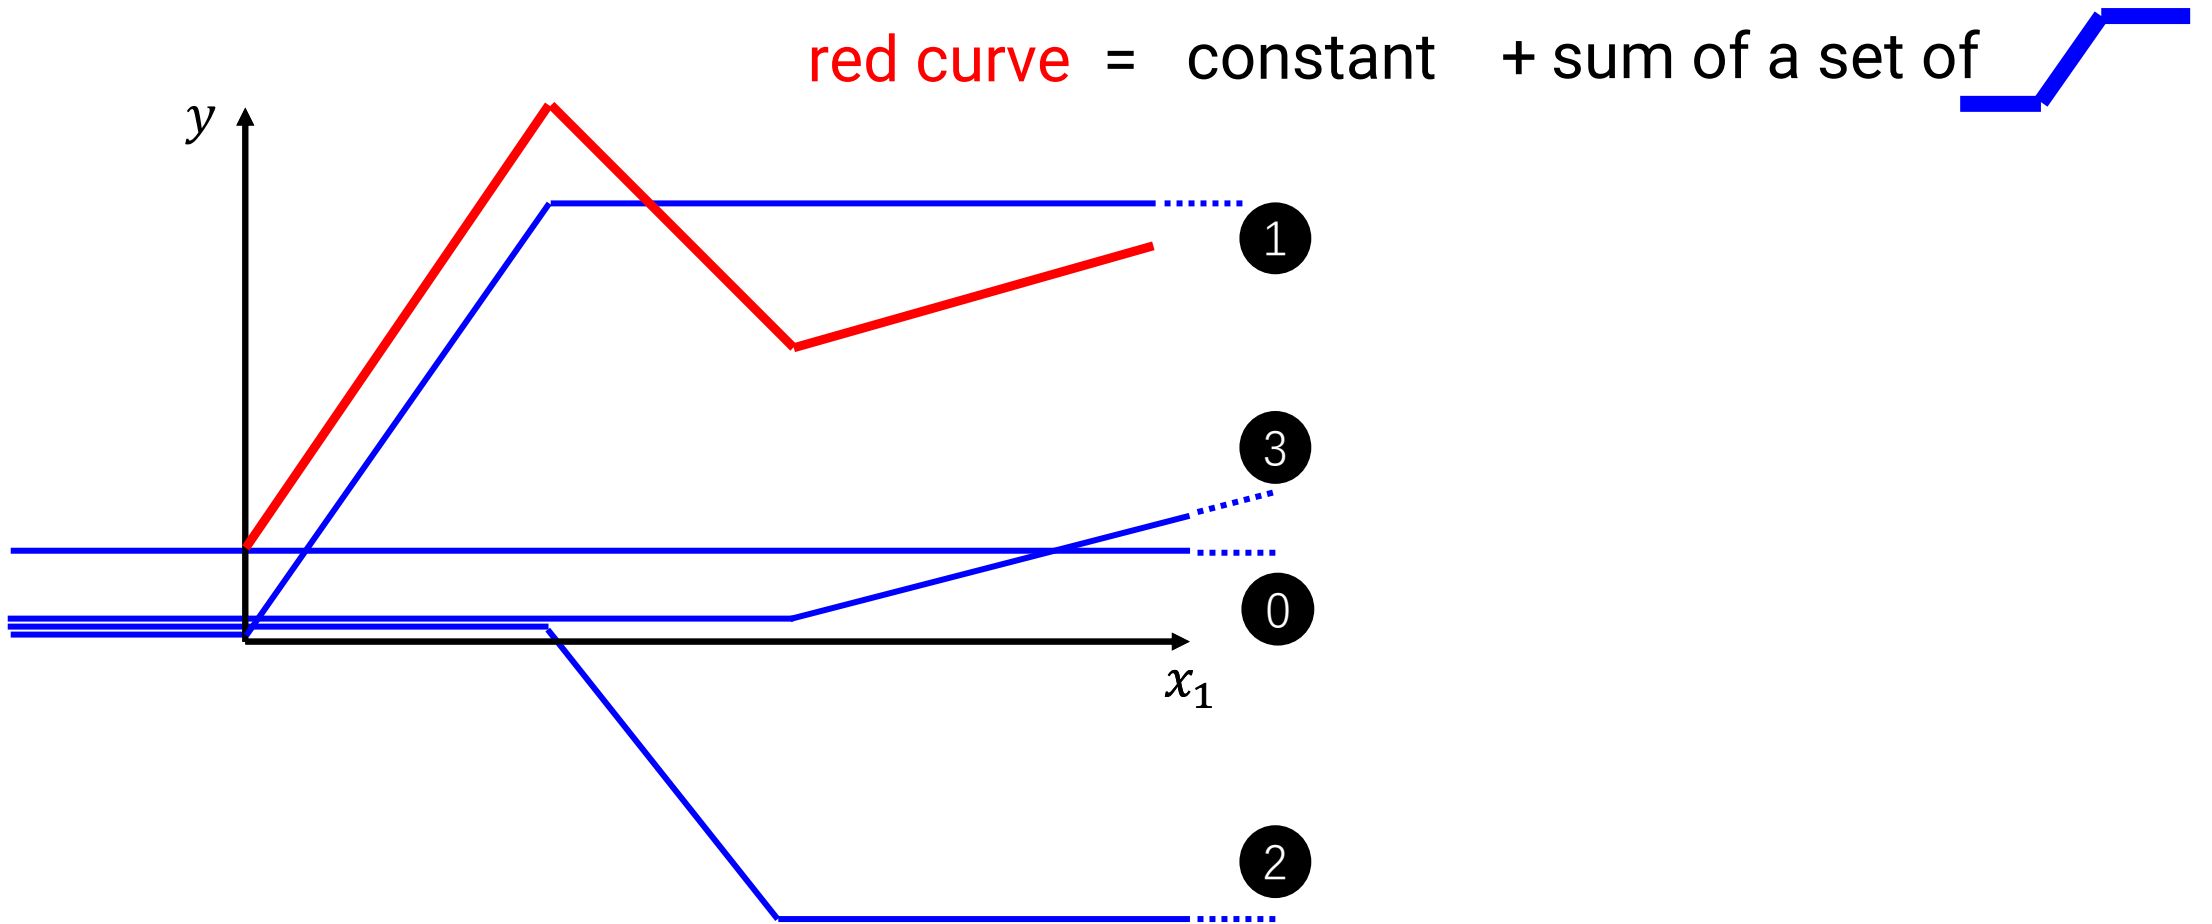

Combine linear functions? **The result is still a linear function~**

$$y = 3x + 1 \qquad y = 5x + 2 \quad \rightarrow \quad y = 3(5x + 2) + 1 = 15x + 7$$

Activation functions are required:

- Sigmoid
- Relu

Sigmoid Function

Sigmoid Function

How to represent
this function?

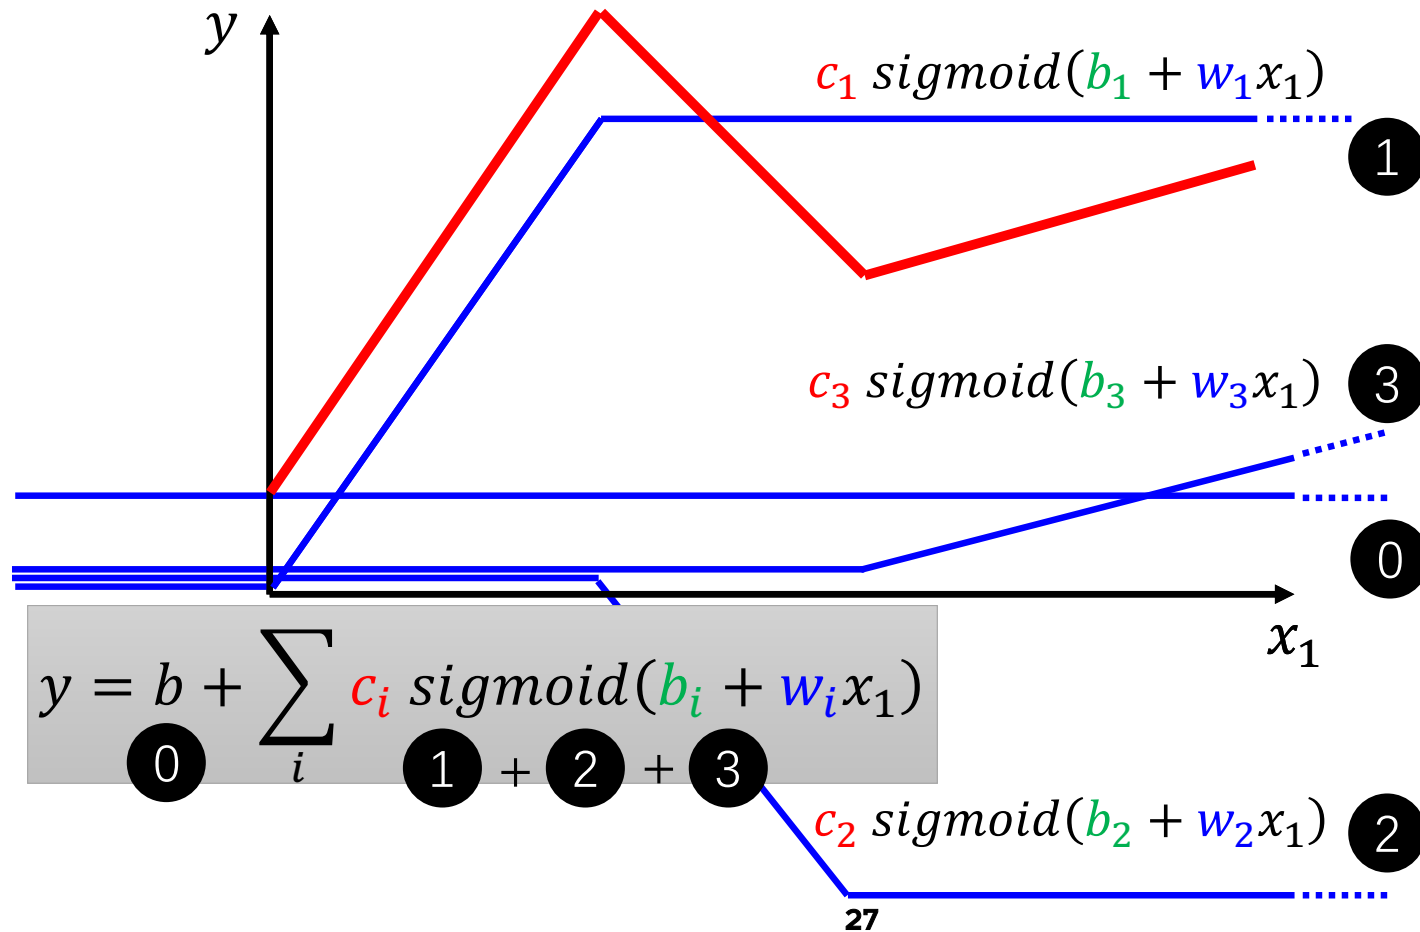

Hard Sigmoid

Sigmoid Function

$$y = c \frac{1}{1 + e^{-(b+wx_1)}}$$

$$= c \text{ sigmoid}(b + wx_1)$$

Combining Sigmoid Functions

Other activation functions

Sigmoid

$$\sigma(x) = \frac{1}{1+e^{-x}}$$

tanh

$$\tanh(x)$$

ReLU

$$\max(0, x)$$

Leaky ReLU

$$\max(0.1x, x)$$

Maxout

$$\max(w_1^T x + b_1, w_2^T x + b_2)$$

ELU

$$\begin{cases} x & x \geq 0 \\ \alpha(e^x - 1) & x < 0 \end{cases}$$

Sigmoid and ReLU

$$y = b + \sum_i c_i \underline{\text{sigmoid}} \left(b_i + \sum_j w_{ij} x_j \right)$$

$$y = b + \sum_{2i} c_i \underline{\text{max}} \left(0, b_i + \sum_j w_{ij} x_j \right)$$

New Model

Combine i Sigmoid functions

$$y = \underline{b + wx_1} \quad \rightarrow \quad y = b + \sum_i c_i \text{sigmoid}(\underline{b_i + w_i x_1})$$

New Model

Combine i Sigmoid functions

$$y = \underline{b + wx_1} \rightarrow y = b + \sum_i c_i \text{sigmoid}(\underline{b_i + w_i x_1})$$

Combine j features

$$y = \underline{b + \sum_j w_j x_j} \rightarrow y = b + \sum_i c_i \text{sigmoid}\left(\underline{b_i + \sum_j w_{ij} x_j}\right)$$

New Model

$$y = b + \sum_i c_i \text{sigmoid} \left(b_i + \sum_j w_{ij} x_j \right)$$

$$r_1 = b_1 + w_{11}x_1 + w_{12}x_2 + w_{13}x_3$$

w_{ij} : weight for x_j for i -th sigmoid

$$r_2 = b_2 + w_{21}x_1 + w_{22}x_2 + w_{23}x_3$$

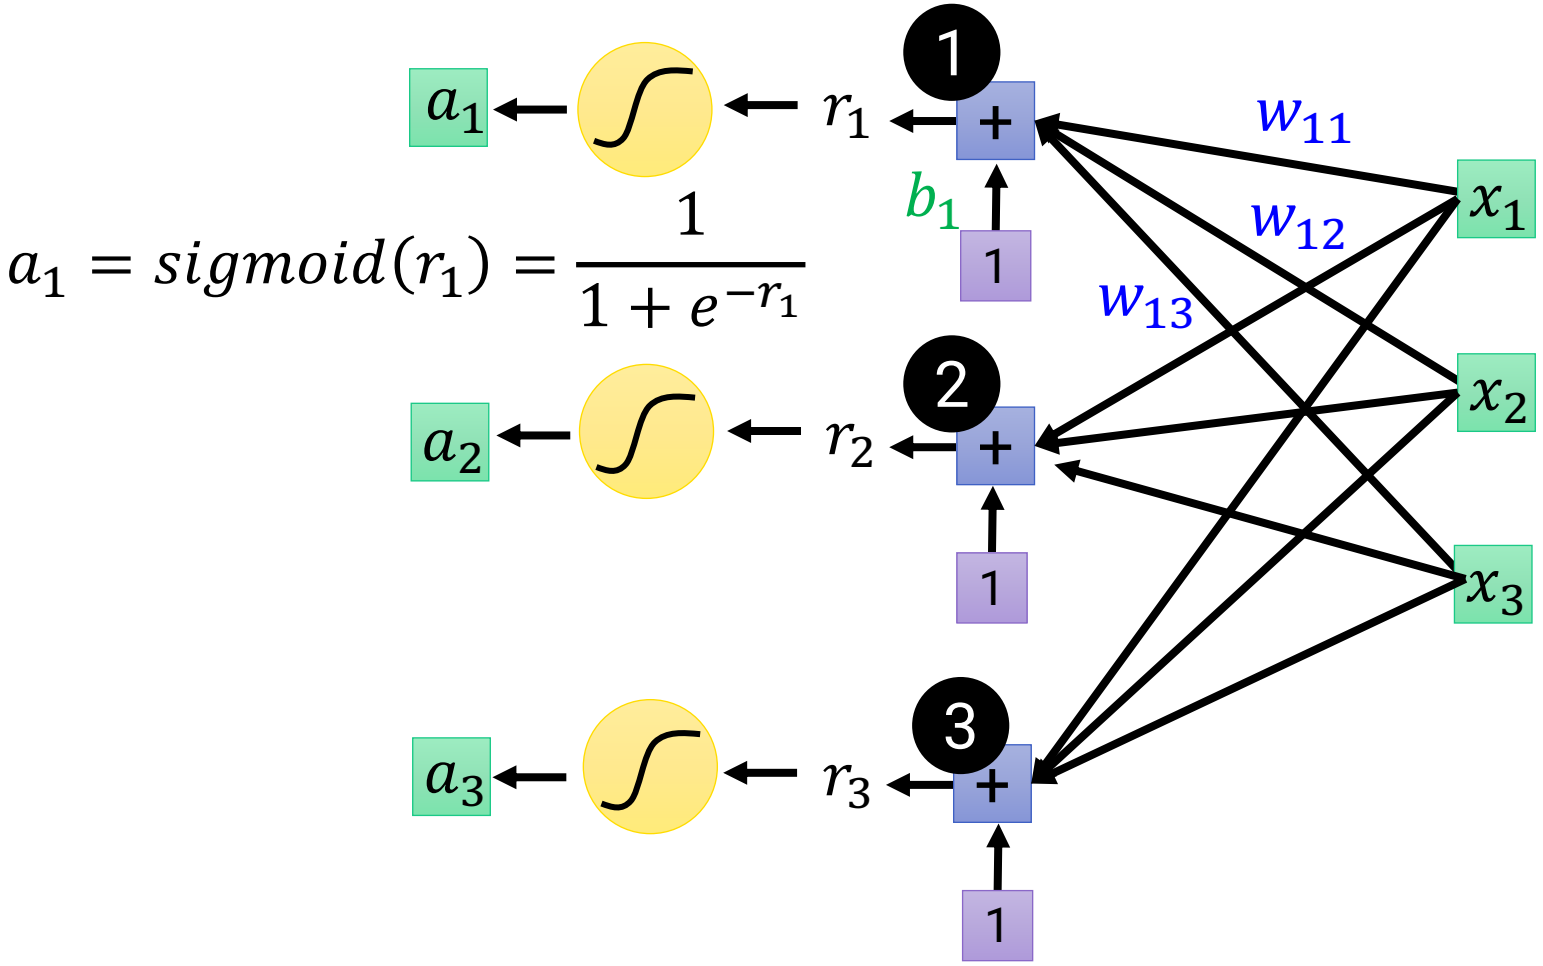

$$r_3 = b_3 + w_{31}x_1 + w_{32}x_2 + w_{33}x_3$$

j is #features
 i is #sigmoid

New Model

$$y = b + \sum_i c_i \text{sigmoid} \left(b_i + \sum_j w_{ij} x_j \right)$$

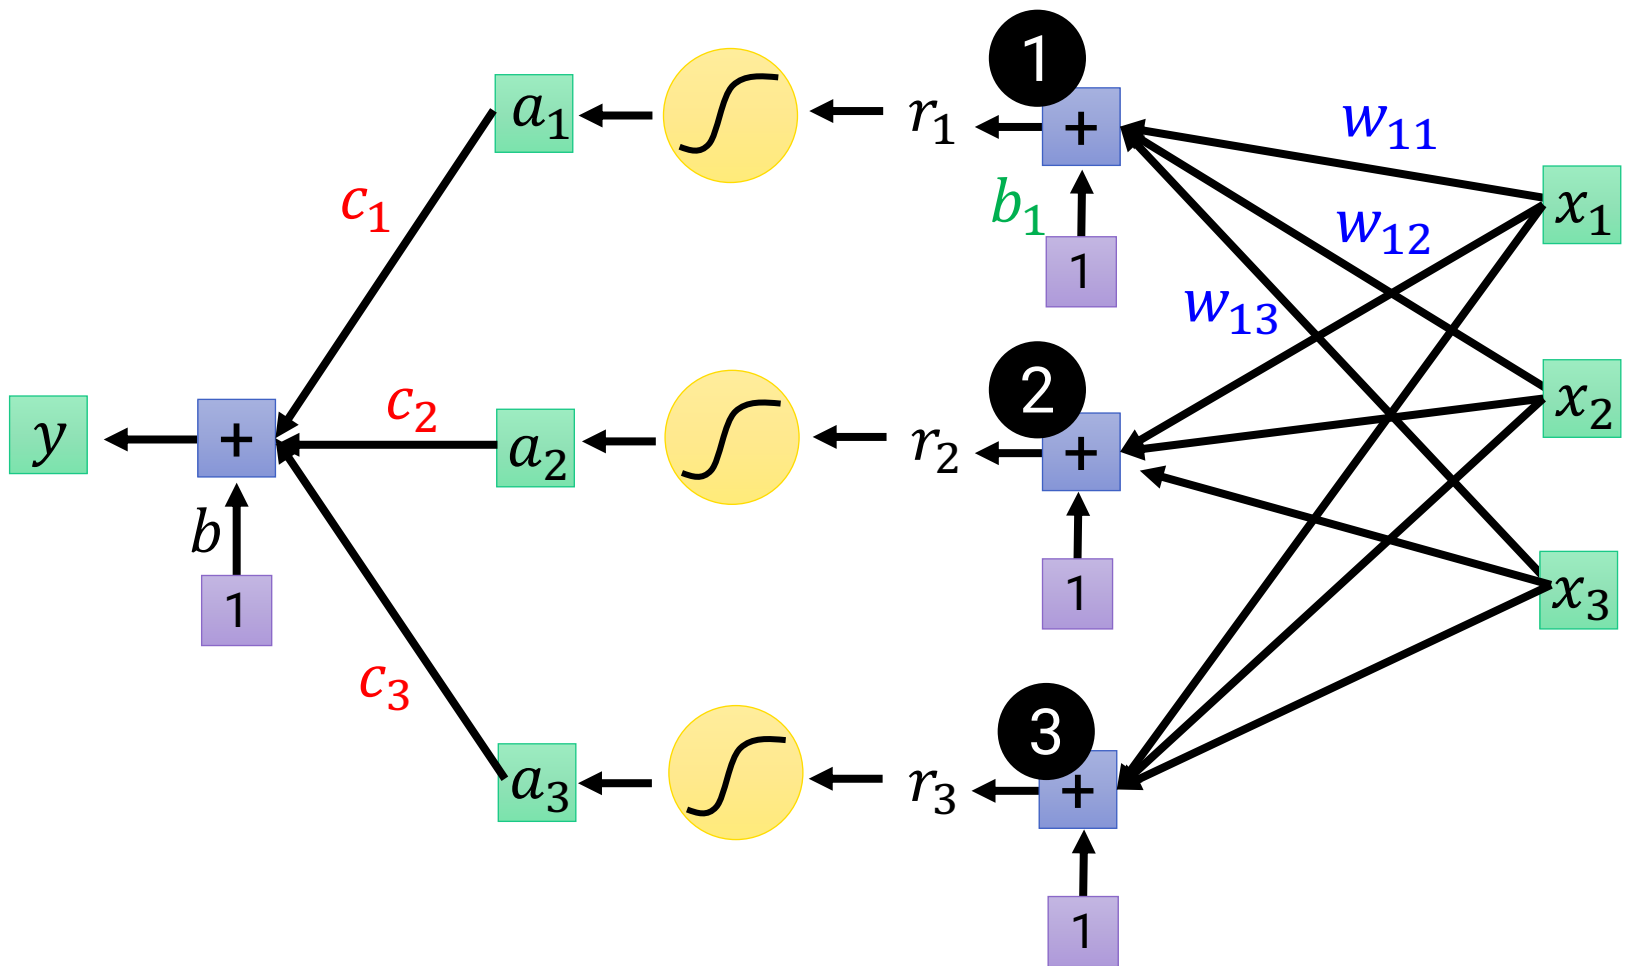

j is #features
 i is #sigmoid

$$a_1 = \text{sigmoid}(r_1) = \frac{1}{1 + e^{-r_1}}$$

New Model

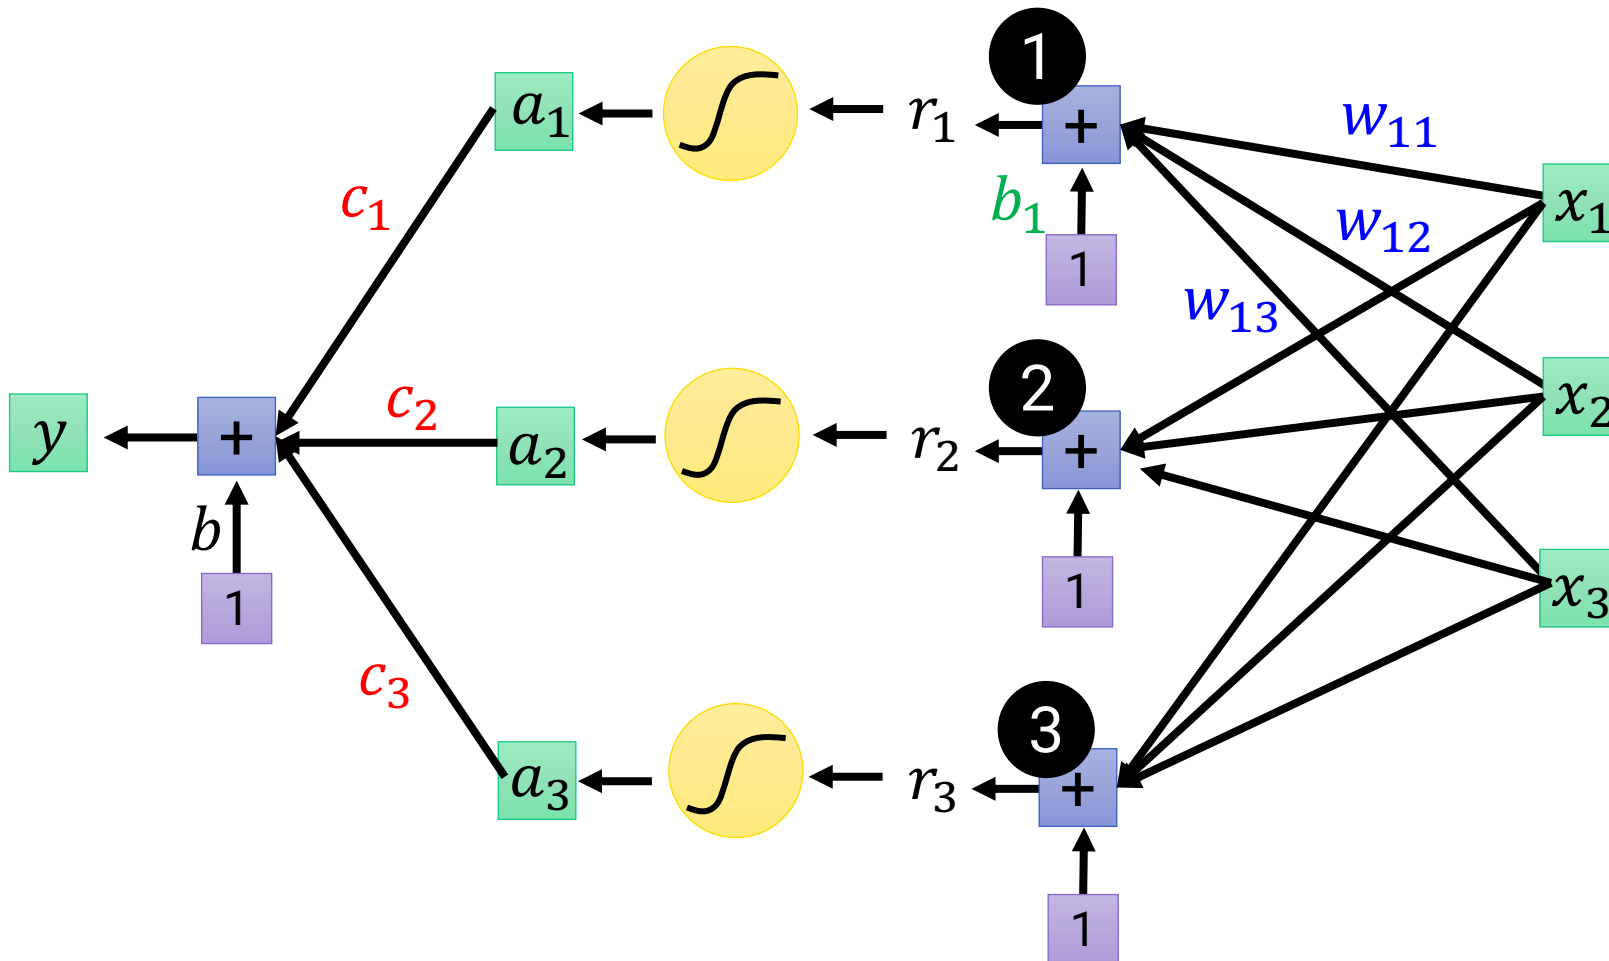

$$y = b + \sum_i c_i \text{sigmoid} \left(b_i + \sum_j w_{ij} x_j \right)$$

j is #features
 i is #sigmoid

Matrix Style

$$y = b + c^T \sigma(b + W x)$$

Minimize Loss

$$\text{Loss: } L = \frac{1}{N} \sum_n e_n$$

Multiple parameters

$$\theta^* = \arg \min_{\theta} L$$

$$\theta = \begin{bmatrix} \theta_1 \\ \theta_2 \\ \theta_3 \\ \vdots \end{bmatrix}$$

(Randomly) Pick initial values θ^0

$$\mathbf{g} = \begin{bmatrix} \frac{\partial L}{\partial \theta_1} |_{\theta=\theta^0} \\ \frac{\partial L}{\partial \theta_2} |_{\theta=\theta^0} \\ \vdots \end{bmatrix}$$

gradient

$$\begin{bmatrix} \theta_1^1 \\ \theta_2^1 \\ \vdots \end{bmatrix} \leftarrow \begin{bmatrix} \theta_1^0 \\ \theta_2^0 \\ \vdots \end{bmatrix} - \begin{bmatrix} \eta \frac{\partial L}{\partial \theta_1} |_{\theta=\theta^0} \\ \eta \frac{\partial L}{\partial \theta_2} |_{\theta=\theta^0} \\ \vdots \end{bmatrix}$$

$$\mathbf{g} = \nabla L(\theta^0)$$

$$\theta^1 \leftarrow \theta^0 - \eta \mathbf{g}$$

Compute the Loss for all data?

$$\theta^* = \arg \min_{\theta} L \quad \text{Loss: } L = \frac{1}{N} \sum_n e_n$$

- (Randomly) Pick initial values θ^0
- Compute gradient $g = \nabla L(\theta^0)$
 $\theta^1 \leftarrow \theta^0 - \eta g$
- Compute gradient $g = \nabla L(\theta^1)$
 $\theta^2 \leftarrow \theta^1 - \eta g$
- ...
- Repeat a set of iterations

Inefficient & ...

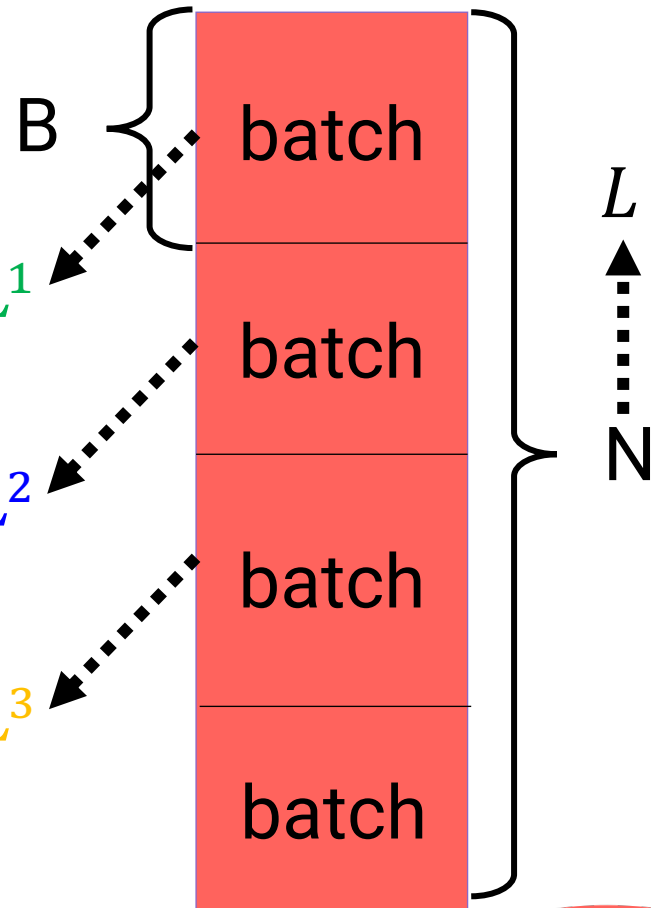

Compute the Loss for all data?

$$\theta^* = \arg \min_{\theta} L \quad \text{Loss: } L = \frac{1}{N} \sum_n e_n$$

- (Randomly) Pick initial values θ^0
- Compute gradient $\mathbf{g} = \nabla L^1(\theta^0)$
update $\theta^1 \leftarrow \theta^0 - \eta \mathbf{g}$
- Compute gradient $\mathbf{g} = \nabla L^2(\theta^1)$
update $\theta^2 \leftarrow \theta^1 - \eta \mathbf{g}$
- Compute gradient $\mathbf{g} = \nabla L^3(\theta^2)$
update $\theta^3 \leftarrow \theta^2 - \eta \mathbf{g}$

1 **epoch** = see all the batches once

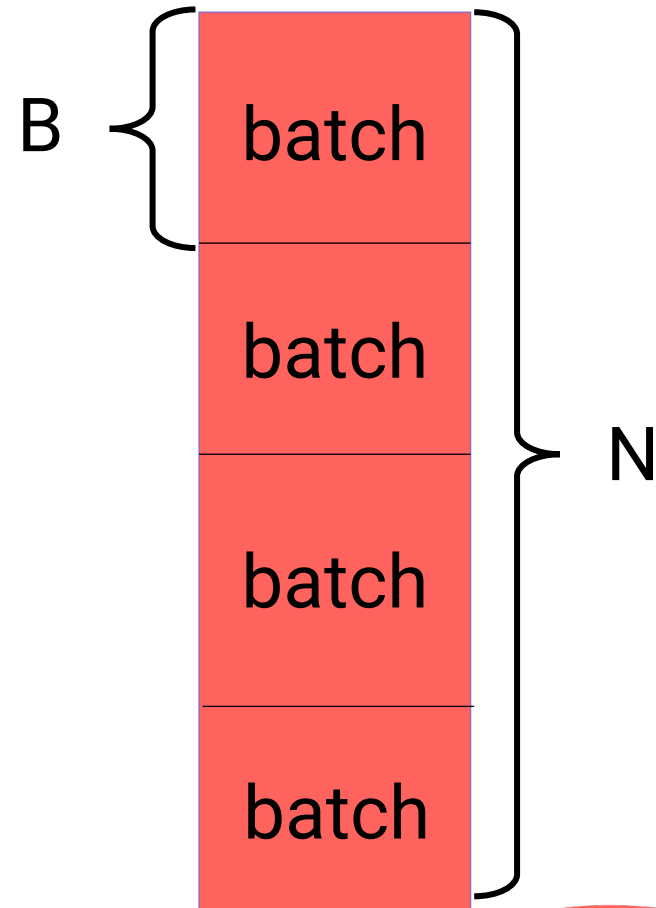

Quiz

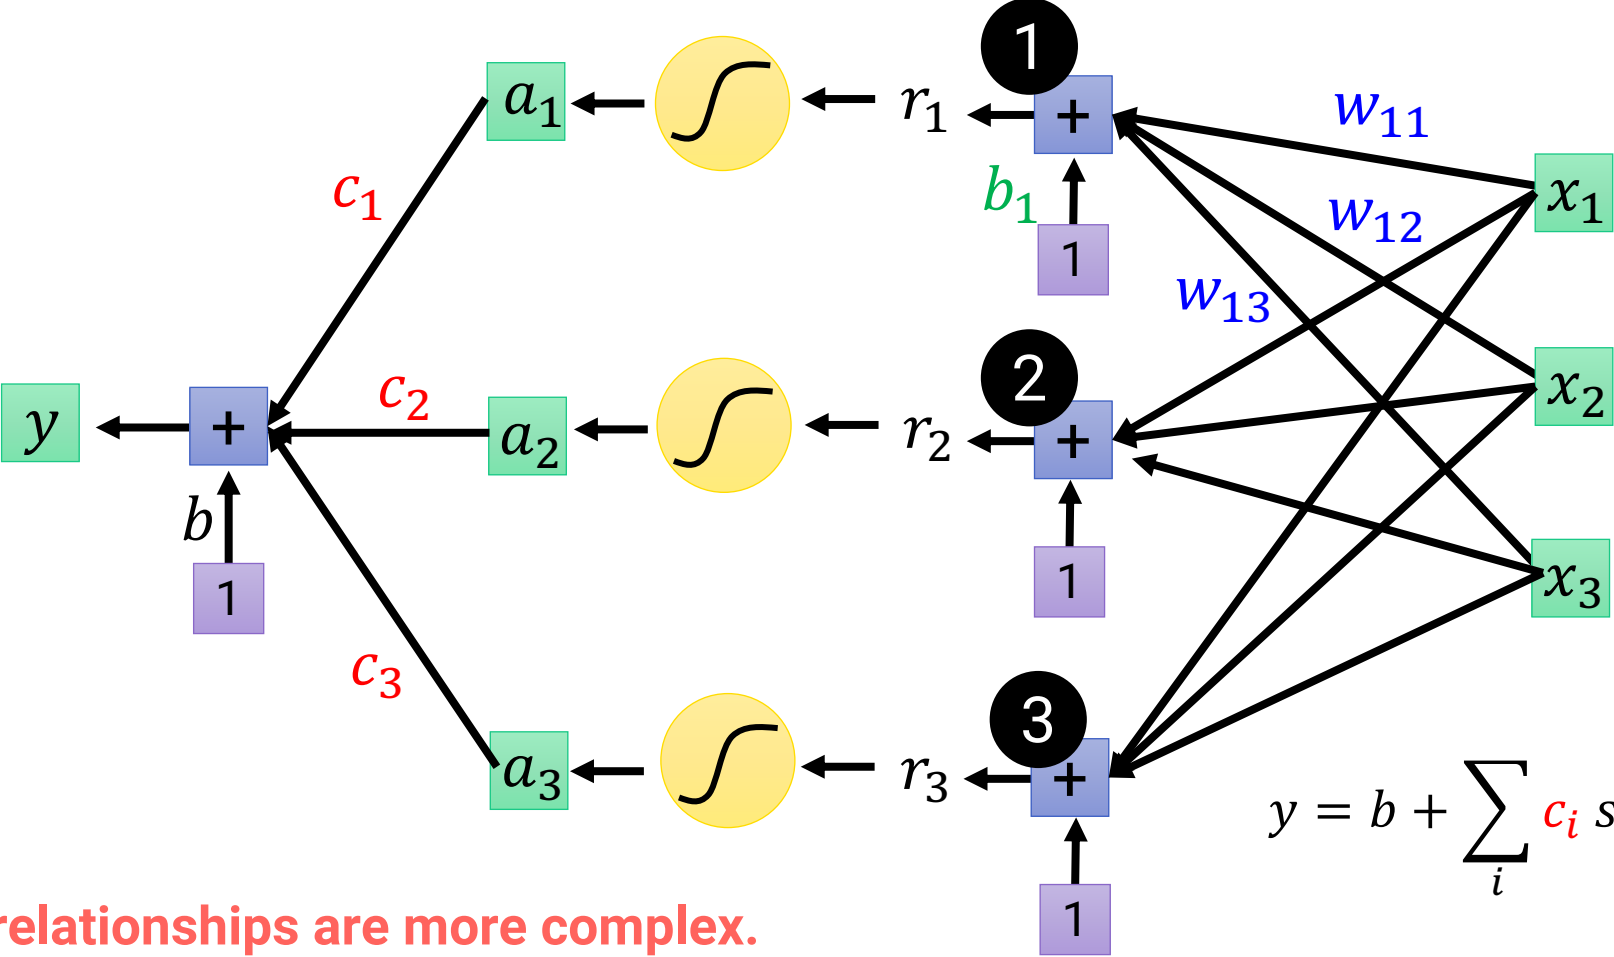

- 10,000 examples ($N = 10,000$)
- Batch size is 10 ($B = 10$)

How many update in **1 epoch**?

1,000 updates

Machine Learning to Deep Learning

j is #features
 i is #sigmoid

$$y = b + \sum_i c_i \text{sigmoid} \left(b_i + \sum_j w_{ij} x_j \right)$$

Real relationships are more complex.

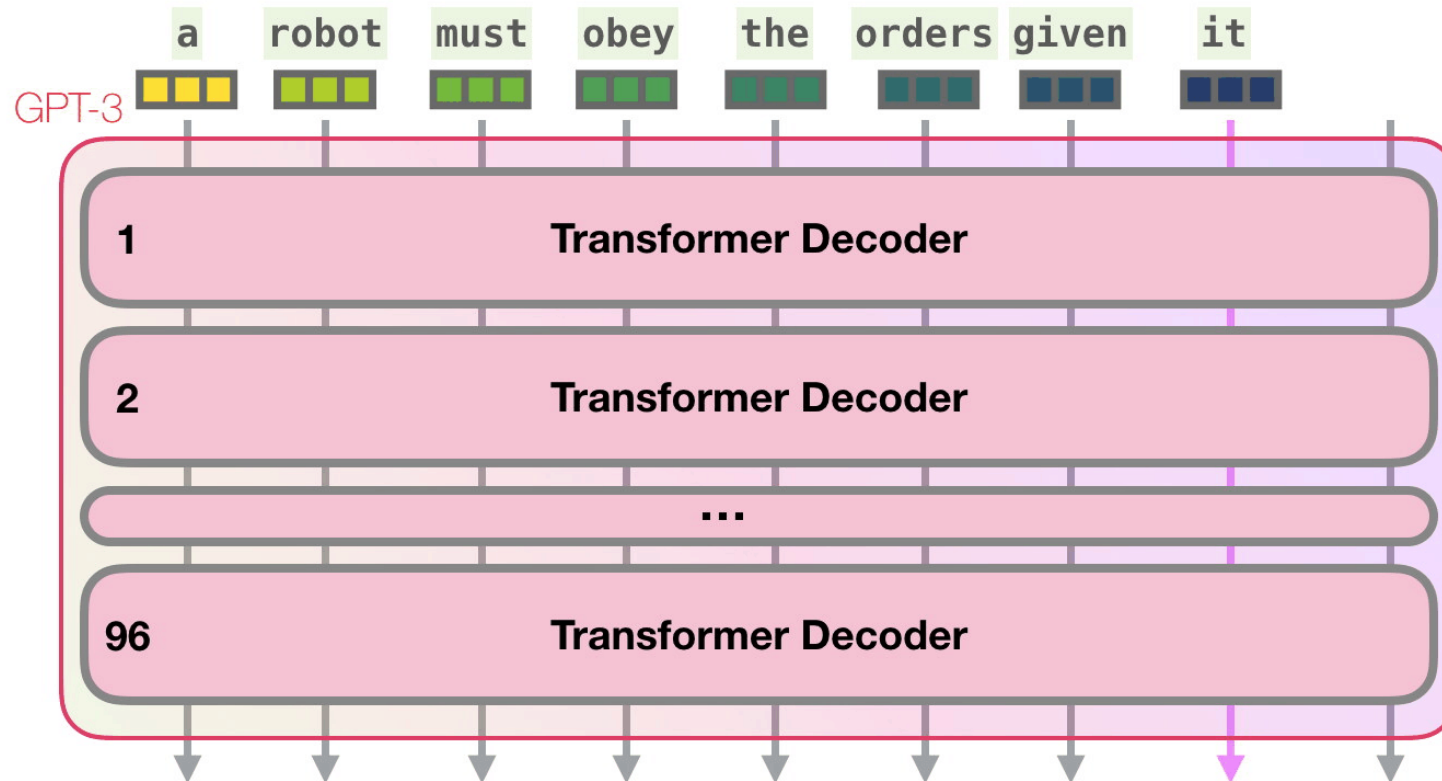

Neural Network

Deep means many layers

#Layers in GPT-3

<https://jalammar.github.io/how-gpt3-works-visualizations-animations/>

generative pre-trained transformer

Deep vs Wide

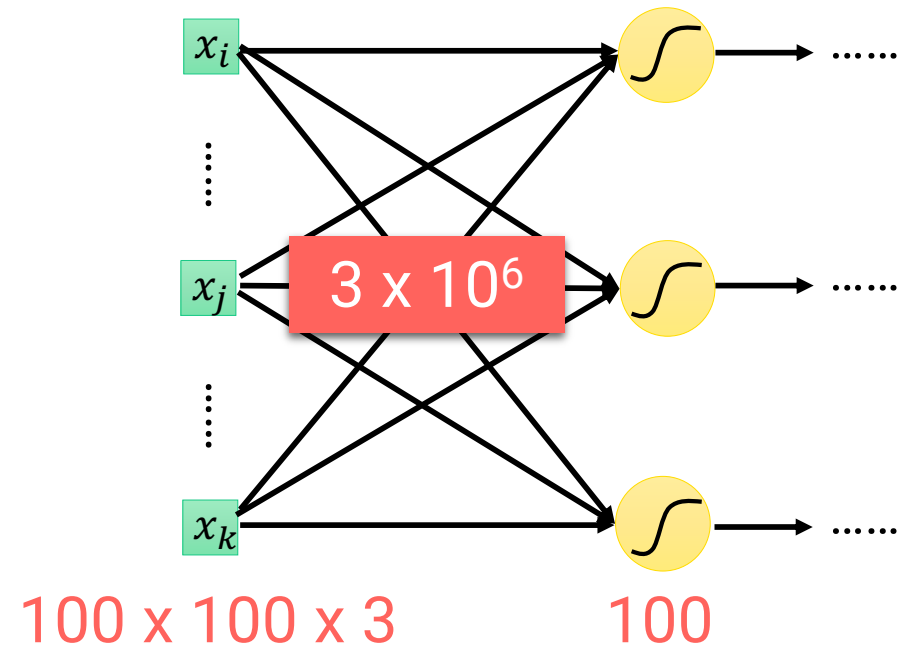

DL in real applications

Domain knowledge -> customized model (neural network)

RGB

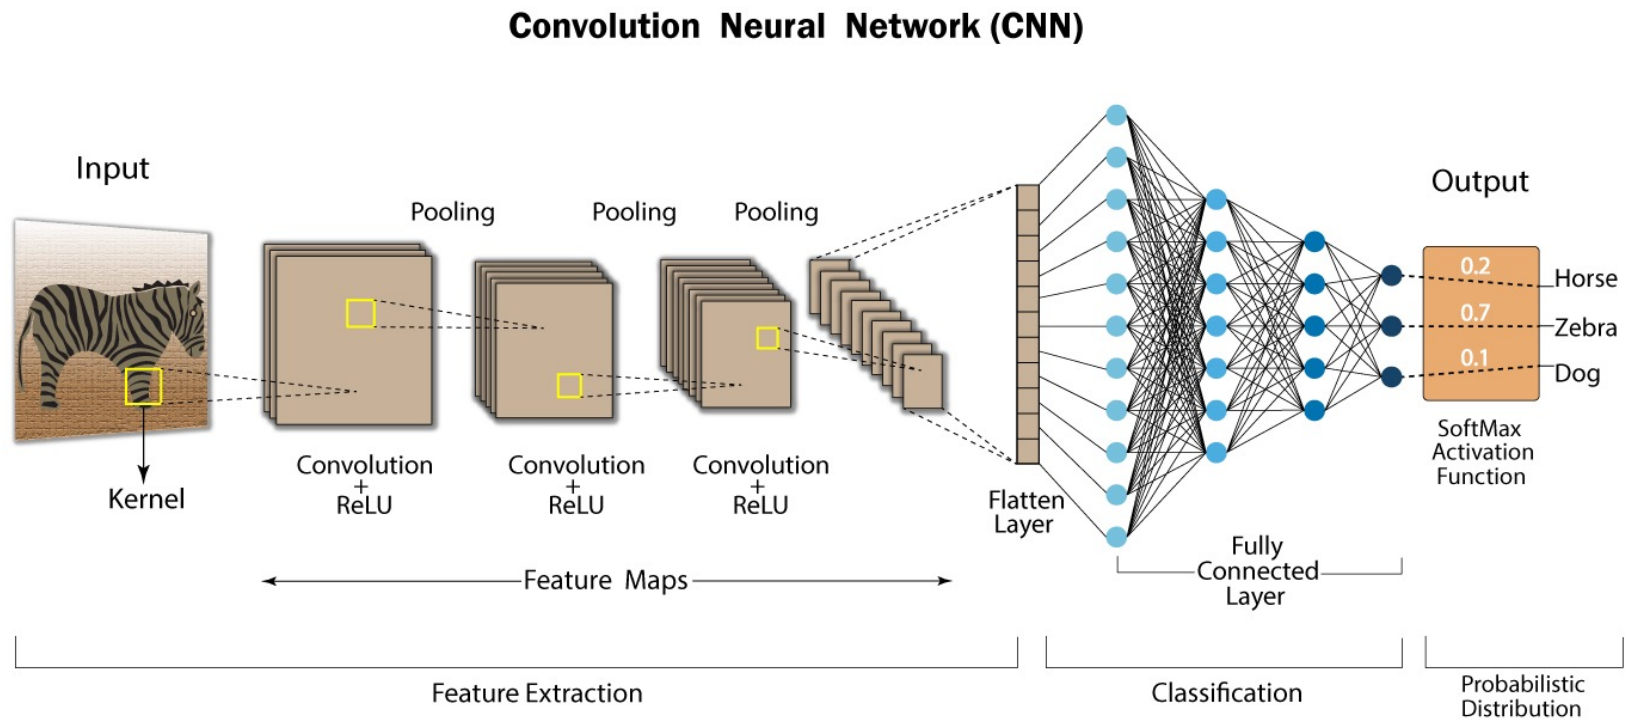

Assume we have an image with 100 pixels
A color can be represented by $(256 \times 256 \times 256)$

DL in real applications

Domain knowledge -> customized model (neural network)

Learning Outcome

Understand the basic idea of ML and DL
